

## 3D Java Update 1.2.3 thru 1.2.7

Updates 1.2.3 through 1.2.7 are minor updates.

### Version 1.2.7

- Updated printer utilities which now allow 3D Java running on Macintosh to print directly as opposed to through a PDF file.
- Document Option "Load only the first 80 counts" now loads the whole drill file but only shows the first 80 counts. This prevents accidental loss caused by saving a drill file with this option set. Previously the data was clipped to 80 counts thus deleting all counts past 80.

### Version 1.2.6

- Corrected the Props disappearing on a page when escaping out of a tool.
- Replaced the missing text box in the arc tool used to enter the number of data points.
- Optimized Imports (internal change that increased speed)
- Checked for the letter "N" in the Serial Number and strips it out if found. This is necessary for some encryption codes during installation.

### Version 1.2.5

- Allow files with floor covers to be opened (but not edited) on a version of 3D Java without the Floor Cover plugin.

### Version 1.2.4

- Macintosh OS X fix - Rotate tool and Symbol box in Label tool were not operating correctly.
- Patch for Macintosh entering of Symbol. Displays a second dialog.

### Version 1.2.3

- Added Show/Hide Shapes function.
- Patch: Bringing window to front for Macintosh is now only implemented on Macintoshes as opposed to both Mac and Windows.
- Added Military Plugin abilities.
